

A woman with dark hair, wearing a long, flowing, gold-colored dress, stands in the center of a cave. The cave's interior is dark and textured with rock formations. A bright, golden light emanates from a large opening in the cave wall behind her, creating a strong backlight effect. The floor of the cave is covered with water, which reflects the light and the woman's dress. The overall mood is ethereal and dramatic.

INTERTEXE

Know what you are wearing.

PRESS KIT · 2026

The only fashion platform that verifies the fiber composition of every product it carries.

Intertexe is a natural fiber fashion discovery platform and iOS scanner. We verify that silk is silk, cashmere is cashmere, and linen is linen — before anything is listed on the platform. Every product on Intertexe contains at least 80% natural fiber. Verified before it is listed. Not after a complaint.

The iOS app includes a scanner that reads any clothing label in real time. Point your camera at any care label or price tag in any store in the world. Intertexe reads the fiber composition instantly, gives it a natural fiber score from 0 to 100, and shows curated natural fiber alternatives at a similar price if the piece falls short.

Most fashion platforms show you what brands want you to see. Intertexe shows you what the label actually says.

COMPOSITIONS VERIFIED BEFORE LISTING

THE PROBLEM

60% of all clothing sold globally is made from plastic-based synthetic fibers. Polyester, nylon, acrylic. Most fashion platforms show you what brands want you to see — not what the label actually says. There is no easy way to know what your clothes are actually made of before you buy them. Labels exist but finding them, reading them, and understanding what they mean takes effort most shoppers do not make.

THE SOLUTION

Intertexe verifies the fiber composition of every product before it is listed. The iOS scanner reads any label in real time and returns an instant natural fiber score. The platform cross-references composition data from brand feeds, label scans, and a proprietary barcode database that grows with every user scan. After enough scans Intertexe will hold the most comprehensive fashion fiber composition database in the world — one that does not exist anywhere else and cannot be replicated quickly.

THE SCANNER

Point your camera at any care label or price tag. Anywhere. Any brand. Any store in the world.

Intertex reads the fiber composition instantly and returns:

- The exact fiber breakdown
- A natural fiber percentage score
- A verdict — Exceptional, Good Quality, A Blend, or Mostly Synthetic
- Six curated natural fiber alternatives at a similar price

Every scan teaches the platform something. Every barcode linked to a composition makes the next scan faster. Over 63,000 barcodes are already in the database before the first public user ever opens the app.

Vacation

Resort dressing for warm water and warm light.
Linen that moves. Silk at sunset.

Evening

For the occasion that deserves the real thing. Silk.
Wool crêpe. Verified.

Tailoring

Investment dressing. The pieces that outlast
every trend. Wool. Cashmere. Cotton.

The White Edit

White in every form. Ivory. Chalk. Cream. All
natural.

THE SCANNER DATABASE

The scanner uses computer vision to read clothing labels in real time. Results come from a proprietary barcode composition database built from real label scans by real users in real stores. Over 63,000 barcodes are already indexed. The database is self-compounding — every scan makes the next scan faster and more accurate. This data does not exist anywhere else.

THE VERIFICATION STANDARD

Every product on Intertexe must contain at least 80% natural fiber to be listed. Composition is cross-referenced against brand affiliate feed data and label scan data. Products that do not meet the standard are not listed regardless of brand name or price point.

THE DIGITAL PRODUCT PASSPORT

The EU Digital Product Passport for textiles arrives in 2026 requiring verified composition data for every garment sold in Europe. Intertexe is building the composition data infrastructure brands and retailers will need to comply. Our API gives enterprise partners access to verified fiber composition data, DPP-ready product records, and catalog enrichment services.

The only platform that verifies what fashion is actually made of — and why that matters now.

The scanner that tells you if your expensive dress is mostly plastic — and what it should have been.

How one app is building the world's most comprehensive fashion fiber composition database — one scan at a time.

The EU Digital Product Passport arrives in 2026. This startup is already building the infrastructure brands will need to comply.

Why natural fiber fashion is having a moment — and the platform that saw it coming.

Microplastics, greenwashing, and the rise of the informed fashion consumer. Meet the app that gives shoppers the truth.
